I acknowledge that I used AI assistance (Copilot) during the development of this Pokémon Web Application assessment. AI tools were used as a supporting resource for understanding technical concepts, generating implementation suggestions and refining the user interface.

All AI-generated suggestions were reviewed and evaluated before being incorporated into the project.

Main AI Prompts and Assistance

1) **Project Setup**
   Prompt used:
   Guide the development of a Pokémon web application using Laravel for the backend, Next.js for the frontend, and PokeAPI as the external data source.
2) **Data Processing**
   Prompt used:
   Explain how to retrieve and normalise Pokémon information, including names, official artwork, types, height, and weight.
3) **Frontend**
   Prompt used:
   Implement a Next.js frontend that retrieves Pokemon data through the Laravel API and displays the information in reusable Pokemon cards.
4) **UI/UX design**
   Prompt used:
   Suggest and refine the page layout (separate into 2 section which are Top and Middle section). For the Top section, it should include an image carousel (a left to right animated image carousel), with two static banners place at the right of the carousel. While the Bottom section should include 2 static images place on both sides (left and right) of the Pokemon listing section, which should be centred below the search bar. Both side static images should remain visible while scrolling through the Pokemon listing.
